

EduVision Administrator Guide

EduVision School Website Platform — Administrator Guide

Version 1.2.0

This guide is for platform owners and super administrators who manage the EduVision system and onboard schools.

1. Super Admin Access

Login at `/admin/login` with the super admin account created during setup or the first-run wizard. The default super admin email and password are configured during installation.

2. System Health Dashboard

Navigate to **System Health** from the admin sidebar to view:

- API and database status
- Redis connectivity
- Storage disk usage
- Memory and CPU load averages
- Backup status and age
- Storage usage per school and per media type

3. Creating and Managing Schools

Create a School

1. Go to **Super Admin**.
2. Click **New School**.
3. Enter the school name, slug, contact details, colours and plan.
4. Optionally create an admin account for the school.
5. Save. The school's website and dashboard are provisioned immediately.

Manage Schools

- Suspend or reactivate schools from the school list.
- Schools are isolated by tenant. Data from one school is never visible to another.

4. Subscriptions, Licences and Billing

Subscriptions

- Each school has a subscription with a plan, status and billing cycle.
- Statuses: Active, Trial, Suspended, Cancelled, Expired.
- When a subscription expires, the school website returns a subscription-inactive message.

Invoices

- Create invoices for schools with line items, due date and tax.
- Mark invoices as Sent, Paid, Overdue or Cancelled.

Licences

- Generate licence keys for enterprise or offline activation.
- Link licences to schools and set seat limits and expiry dates.

5. Storage and Backups

Storage Reporting

- **System Health > Storage Usage** shows total usage, usage per school and usage per media type.
- Each school has a `maxStorageMb` limit. Schools approaching their limit should upgrade or delete old media.

Backup Status

- The backup service is run automatically by the backup Docker container once per day.
- It dumps the PostgreSQL database and archives the uploads directory.
- **System Health > Backups** lists recent backups, sizes and age.
- Backups older than `BACKUP_RETENTION_DAYS` are removed automatically.

Manual Backup and Restore

Run the backup script manually:

```
docker compose -f docker-compose.prod.yml exec backup backup.sh
```

Restore a database backup:

```
cd /backups
zcat eduvision-db-DATE.sql.gz | psql -h localhost -U eduvision -d eduvision
```

Restore uploads:

```
cd /
tar -xzf /backups/eduvision-uploads-DATE.tar.gz
```

6. User and Role Management

- Super admins can view and edit all users from the **Users** module.
- Roles:
 - `SUPER_ADMIN` — full platform access
 - `SCHOOL_ADMIN` — manage one school
 - `SCHOOL_STAFF` — manage content and media
 - `TEACHER` — results and attendance
 - `PARENT` and `LEARNER` — portal access

7. Audit Logs

Every mutating API request is recorded in the audit log with:

- Action and entity
- User ID and school ID
- IP address and user agent
- Timestamp

View recent activity from the **Super Admin** dashboard or query the AuditLog table directly.

8. Monitoring and Alerts

- The `/health` endpoint returns a basic status.
- The `/health/detailed` endpoint returns database, Redis, storage and memory checks.
- Prometheus metrics are available at `/metrics`.
- Configure external uptime monitoring to poll `/health`.

9. Security

- HTTPS with TLS 1.2+
- Passwords hashed with bcrypt
- JWT authentication in httpOnly cookies
- Role-based access control
- Helmet security headers
- Rate limiting on login and general API
- File type and size validation on uploads
- SQL injection protection via Prisma ORM
- XSS protection through output encoding
- CSRF protection through same-site cookies and origin checks

10. Lead Management

Demo requests and sales enquiries submitted through `/demo` and `/contact` are stored in `uploads/private/leads/`. Access to this directory is blocked by Nginx.

11. Scaling

- Run multiple API replicas behind Nginx for horizontal scaling.
- Use an external Redis instance for shared caching.
- Use S3-compatible storage for media to remove local disk dependency.
- Use a managed PostgreSQL service for database scaling.

12. Troubleshooting

Issue	Solution
School cannot log in	Verify subscription status and user <code>isActive</code> flag.
API returns 403 for public site	Check school slug, custom domain or <code>subscriptionStatus</code> .
Backups not appearing	Ensure the backup container is running and <code>BACKUP_DIR</code> is writable.
Redis errors	Verify <code>REDIS_URL</code> and that the Redis container is healthy.

13. Maintenance Windows

- Apply migrations during low-traffic windows.
- Restart containers one at a time when scaling behind a load balancer.
- Test restores on a staging environment before production.
